C.Comment: The acidic and basic fibroblast growth factors are the major endothelial-cell types an vitro (although bFGF is 30-100 times more potent than aFGF in stimulating tell types in vitro (although bFGF is 30-100 times more groups than does aFGF.

141681 segs, 52070155 residues Searched:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Scoring table:

141681 Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt\_42:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TISSUE SPECIFICITY: Plasma FN (soluble dimeric form) is secreted
by hepatocytes. Cellular FN (dimeric or cross-linked multimeric
forms), made by fibroblasts, epithelial and other cell types, is
deposited as fibrils in the extracellular matrix.
INDUCTION: Glucocorticoids suppressed mRNA expression and protein

TISSUE SPECIFICITY: Plaema FN (soluble dimeric form) is secreted
by hepatocytes. Cellular FN (dimeric or cross-linked multimeric
forms), made by fibroblasts, epithelial and other cell types, is
deposited as fibrils in the extracellular matrix.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDLINE=96183658; PubMed=8603103;
Gehris A.L., Brandil D.W., Lewis S.D., Bennett V.D.;
"The exon encoding the fibronectin type III-9 repeat is
constitutively included in the mRNA from chick limb mesenchyme and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDIINE-88050950; PubMed-2823899; McDuine S., Obara M., Karasaki Y., Taniguchi H., Gotoh S., Tsudomura E., Higashi K., Chsato K., Hiarno H.; Genetic analysis of the cell binding domain region of the chicken
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -!- PTM: Sulfated (By similarity).
-!- SIMILARITY: Contains at least 2 fibronectin type I domains.
-!- SIMILARITY: Contains at least 8 fibronectin type III domains.

Call Amphibian Pleurodeles wall fibronectin: cDNA cloning and developmental expression of spliced variants.";

Call Adhes. Commun. 1:33-91(1993).

-!- FUNCTION: Fibronectins bind cell surfaces and various compounds including collagen, fibrin, heparin, DNA, and actin. Fibronectins are involved in cell adhesion, cell motility, opsonization, wound healing, and maintenance of cell shape (By similarity).

There are differences in the tissue distribution and concentration of these 2 growth factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -!- SUBUNIT: Monomer.
-!- MISCELLANEOUS: This protein binds heparin more strongly than does
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -1- SIMILARITY: Belongs to the heparin-binding growth factors family.
                                                                                                       01-FEB-1991 (Rel. 17, Created)

Ma R.Z., Teuscher C.;
Submitted (MAY-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: The heparin-binding growth factors are angiogenic agents in vivo and are potent mitogens for a variety of cell types in vitro. There are differences in the tissue distribution and concentration of these 2 growth factors.
-!- SUBUNIT: Monomer.
-:- SUBUNIT: Monomer.
-:- TATATIANEOUS: This protein binds heparin more strongly than does

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: The heparin-binding growth factors are angiogenic agents in vivo and are potent mitogens for a variety of cell types in vitro. There are differences in the tissue distribution and
                                         -1- SUBUNIT: Monomer.
-1- MISCELLANEOUS: This protein binds heparin more strongly than does
                                                                                                    -!- SIMILARITY: Belongs to the heparin-binding growth factors family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gallus gallus (Chicken).

"Elevated expression of basic fibroblast growth factor in an immortalized rabbit smooth muscle cell line.";
Am. J. Pathol. 143:518-527(1933).
-!- FUNCTION: The heparin-binding growth factors are angiogenic agents in vivo and are potent mitogens for a variety of cell types in vitro. There are differences in the tissue distribution and concentration of these 2 growth factors.
                                                                      more strongly than does
                                                                                                                                             -!- SIMILARITY: Belongs to the heparin-binding growth factors family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

-1- FUNCTION: WIDE-SPECTRUM MITOGENIC, ANGIOGENIC, AND NEUROTROPHIC
FACTOR: IMPLICATED IN A MULTITUDE OF PHYSIOLOGIC AND PATHOLOGIC
FACTOR: INPLICATED IN A MULTITUDE OF PHYSIOLOGIC AND PATHOLOGIC
FACTOR: INPLICATED IN A MULTITUDE OF PHYSIOLOGIC AND PATHOLOGIC
FACTOR: INPLICATED IN A MULTITUDE OF PHYSIOLOGIC AND PATHOLOGIC
FACTOR IMPLICATED IN A MULTITUDE OF PHYSIOLOGIC AND PATHOLOGIC
FACTOR AND TUMOR GROWTH. POTENT MITOGEN AND CHEROATTRACTANT FOR
MESENCHYME-DERIVED CELLS. IMPLICATED IN THE DIFFERENTIATION,
FROLIFFAZION, AND MAINTENANCE OF CELLS IN THE CENTRAL NERVOUS
SYSTEM AND IN BONE FORMATION. MAJOR ANGIOGENIC FACTOR THAT ALSO
ACTIVATES TUMOR NEOVASCULARIZATION (BY SIMILARITY)
--- SUBMILARITY: FORMA A QUATERNARY COMPLEX WITH TWO FGFRI AND AT LEAST
ONE HEPRANA SULFATE (BY SIMILARITY)
--- SIMILARITY: TO THE HEPARINAL TRANSLATION; MANY FRAMESHIFTS WERE
INTRODUCED FROM RESIDUES TY, 88, 93 AND 149 DOWNWARD TO EXTEND THE
SIMILARITY TO THE HUMAN SEQUENCE AS WELL AS ON THE BASIS OF
PARTIAL AMINO-ACID SEQUENCING.

EMBL: L75974; AAAAS394.1; ALT FRAME.

These polypeptides have insulin-binding and intercellular adhesion activity

The method is for the control of human immunodeficiency virus (HIV) infection using a composition which comprises a functional substance which participates in the infection of HIV. The method is used to control HIV-infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the oligopeptide ColV, which was used in the development of a novel method for increasing the efficiency of gene introduction into a target cell using a retroviral vector. The method comprises carrying out viral infection of the target cell in the presence of a retrovirus and target cell binding substance or substances. The method can be used to effectively introduce genes into target cells for the gene therapy of cancer and viral diseases, e.g. AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120

The method comprises carrying out viral infection of the target cell in the presence of a retrovirus and target cell binding substance or substances. The method can be used to effectively introduce genes into target cells for the gene therapy of cancer and viral

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAR34585-90 are polypeptides which were used the production of recombinant polypeptides which contained the intracellular adhesive domain of human fibronectin, a spacer and an insulin binding domain. These polypeptides have insulin-binding and intercellular adhesion activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Target cell; transfection; retroviral vector; gene therapy; cancer; viral disease; acquired immunodeficiency syndrome; AIDS.
